

Sophos Hardware Sizing Questionnaire

Customer Guide

Your Sophos account manager or partner has sent you a link to a short questionnaire covering your firewall, switch, and/or wireless requirements. This guide explains what to expect.

1. What to expect

The questionnaire takes about 10–15 minutes per site and helps your Sophos contact recommend the right Sophos hardware. You can add more than one site. Progress is saved automatically so you can finish later in the same browser (and on the server for this link).

2. Opening the link

- Enter your work email address
- It must be on the same company domain the link was sent to
- This check is remembered for the browser session

3. Completing the questionnaire

- Sites — add each physical location
- Configure — progress shows Site X of Y · Firewall (etc.); branch sites use a shorter path with Advanced options for WAF/TLS/HA
- Review — confirm your answers, then submit
- You will not see model recommendations in the wizard — your account team reviews sizing after submit

Important: Progress is saved on this device and on the server. You can close the tab and resume later with the same link on another device.

4. Information to have ready

- Firewall: circuit speed, typical and peak usage, VPN, user counts
- Switches: ports needed per unit, how many switch units, PoE device counts
- Wireless: facility details and a floor plan upload if available

5. After you submit

You will see a confirmation page. Your Account Manager or Sophos partner (depending on who sent the link) reviews the recommendation with a Sales Engineer as needed. If they ask you to correct answers, they will reopen the same link so you can submit again.
