

Sophos Hardware Sizing Tool

Account Manager & Sales Engineer Guide

This guide walks Account Managers and Sales Engineers through creating sizing links, sharing them with customers, and reviewing the recommendations that come back.

1. What this tool does

The Sophos Hardware Sizing tool turns a customer's environment details into a right-sized hardware recommendation for Sophos Firewalls, Switches, and Wireless access points.

- Send a customer a simple, guided questionnaire covering one or more sites
- Get back Minimum / Recommended / Optimal firewall and switch model options with a bill of materials (BOM)
- Hand off wireless / access point scoping to the Sophos presales wireless team
- Track every sizing request from a single dashboard

2. Signing in and roles

Sign in with the email and password provided by your team. Your role determines what you see on the dashboard:

- Account Manager — sees only the sizing links you personally created, and the submissions against them
- Sales Engineer — sees every sizing link across the team, who created each one, and can access Catalog admin

3. Creating a sizing link

From the dashboard, click “New link” to open the create-request form. You will need:

- Customer / company label (required) — shown to the customer on the questionnaire
- Vanity URL slug — auto-suggested from the label, or set your own
- Contact name (optional) and contact email (required) — the person at the customer you are sending the link to
- Link expiry (optional) — after this date the link stops accepting submissions

After submitting, you will land on the request's detail page with a copyable link to send to the customer.

4. Sharing the link with the customer

Copy the link and send it to your contact directly (for example, by email). When they open it:

- They are first asked to confirm their email address
- Access is granted to anyone using an email on the same domain as the contact email you entered — not only that one exact address
- Once verified, they see the sizing questionnaire (Sites, Configure, and Review steps)

5. Reviewing a submission

Once the customer submits, the request's detail page shows:

- A consolidated bill of materials (BOM) across all sites and products
- Per-site breakdowns for Firewall, Switches, and Wireless
- Minimum / Recommended / Optimal tier options you can switch between per site — the BOM updates automatically
- A wireless handoff button to email or download a summary for the Sophos presales wireless team, when wireless was requested

6. Before you quote the customer

Important: Always review the auto-generated recommendation with your Sales Engineer before sending a formal quote to the customer. The tool provides a starting point based on the answers given — it does not replace a technical review.

7. Catalog admin (Sales Engineers only)

Sales Engineers can open “Catalog admin” from the navigation to edit the firewall and switch models the sizing engine recommends from, including order SKUs, without needing a redeploy.

8. Troubleshooting

- Link expired: create a new link for the customer — expired links no longer accept submissions
- Customer says their email does not match: double-check the contact email domain you entered matches the customer's actual email domain
- Older links created before this feature has no contact email on file, so any customer can open them — email verification is only enforced when a contact email is on record
